Practice Model - About This Dashboard

This is a self-built practice model created to demonstrate data reconciliation, dashboard design, and financial/enrollment analysis skills using Power BI and DAX.

What it is: A fictional dataset structured to mirror real higher-education financial systems, including transaction detail, accounts receivable/waivers, enrollment, course-level revenue and indirect cost allocation, bond authorization tracking.

What's fictional: All institution names, dollar amounts, and individual records are randomly generated and fictional. No real student, financial, or personnel data is used anywhere in this model.

What's realistic: The structure, how these tables relate to each other, the reconciliation logic (e.g., cost-per-credit-hour indirect cost allocation), and the relationships between funds, departments, and accounts, is built to reflect how these systems genuinely connect in practice.

Why I built it: To practice and demonstrate the kind of multi-source data reconciliation and reporting I do in my current role, applied to a broader, cross-institutional dataset.

Data Scope & Parameters

Financial transaction data (data tab): Spans Fiscal Year 2024 through Fiscal Year 2026 (7/1/2023 to 6/30/2026).

Enrollment, Waiver, Financial Aid, and Course Costing data: Spans Fall 2023 through Spring 2026 (three academic years: 2023-24, 2024-25, 2025-26).

Bond authorization dates: Span 2023 to 2026.

Figures shown on any page reflect whatever combination of Institution, Fund Type, Academic Year, and/or Term is currently selected in that page's slicers. Where slicers are set to "All," totals reflect the full multi-year dataset described above, not a single period.

How Key Figures Are Calculated

Net Position / Net Margin %: Revenue (or Direct Revenue) minus Expenditures (or Indirect Cost), divided where shown as a percentage. These reflect actual, closed-period totals, not projections. The data tab contains only actual transactions (Budget, Expenditure, Revenue); encumbrance data is not included in this table, consistent with actual transactions only being reflected here.

Total Available (Bonds): Authorized Amount minus Spent minus Encumbered. In many state systems, encumbrances are tracked separately from authorizations and spending.

Avg Tuition Rate Per Credit: A simple average across whatever terms are in scope, each term counts equally regardless of revenue generated.

Net Margin % (weighted): Calculated from summed totals (Net Revenue divided by Direct Revenue) across whatever scope is selected. Periods with more revenue carry proportionally more weight, unlike a simple average.

Indirect Cost Allocation: Cost-per-credit-hour method, see Course Costing assumptions below.

Waiver Rate %: Total Waiver Amount divided by Total AR Charges (all charge types combined: tuition, fees, housing, meal plans). Each student may have multiple charge lines per term (e.g., separate Tuition, Fees, and Housing charges), consistent with how Banner tracks student accounts; a student's waiver, when applied, is assumed to apply consistently across all of that student's charge lines in a given term. Waivers are further classified by Waiver Category (Statutory, Contractual, Presidential, Other).

Waiver funding source is not modeled. In practice, waivers may be absorbed by different funds depending on their source and purpose (e.g., institutional operating funds vs. auxiliary funds vs. state or grant reimbursement). This model treats all waivers as a uniform reduction to charges without distinguishing which fund ultimately bears the cost.

Ancillary revenue (building rentals, theatre revenue, daycare, parking, etc.) is modeled as a separate tab for clarity in this practice file.

Key Assumptions - Course Costing Model

Indirect cost allocation is calculated using a cost-per-credit-hour method: each building's total annual cost (operating expenses plus depreciation) is divided by its total annual credit hours taught, then applied to each course based on its own credit hours (enrollment multiplied by credit hours).

A 50/50 split between operating cost and capital/depreciation cost is assumed for each course's indirect cost allocation. This was a simplifying assumption for this practice model, not a documented industry standard.

Tuition Rate Per Credit is randomly generated per course ($350 to $650 per credit) and is not tied to a real published tuition schedule.

Course catalog is illustrative, not comprehensive. Three sample courses per school per term were generated, not a full course catalog; a real implementation would allocate indirect cost across every course actually taught in a building, which would change the per-course cost significantly.

Building/facility data (square footage, operating cost, depreciation) is randomly generated and does not reflect any real facility.

The underlying approach (allocating indirect facility costs based on a usage metric like credit hours taught) is a recognized method in higher-ed cost accounting, often called activity-based costing or cost-per-student-credit-hour allocation. NACUBO (the higher-ed finance association) and many institutional research offices use variations of this to estimate the "real" cost of instruction beyond just direct expenses.

This kind of course-level cost allocation work has precedent.

Reading the Course Details page: This page lets you isolate a single course and compare its performance across institutions. Because the Term and Academic Year slicers default to "All," the figures shown reflect a course's combined performance across all three academic years (2023-24 through 2025-26) unless a specific year or term is selected. Net Margin % is a true weighted average across whatever terms are in scope. Avg Tuition Rate Per Credit is a simple average across the terms in scope, treating each term equally.

Key Assumptions - Enrollment Model

Enrollment figures are randomly generated per institution, term, student level, and residency status. They do not reflect any real institution's actual enrollment history or trends.

The historical trend (Fall 2023 through Spring 2026) includes intentional random variation to simulate realistic term-over-term fluctuation, but the direction and magnitude of any single institution's trend is not meaningful or predictive.

FTE (Full-Time Equivalent) is calculated using a simplified ratio (85% for undergraduate, 60% for graduate) rather than actual credit-hour-based FTE calculations a real registrar's office would use. Undergraduate/Graduate and In-State/Out-of-State splits are approximated using fixed percentages, not derived from real demographic data.
